

LEVEL MATTERS

Did you know?

When you're looking for flexible relay options, the SITRANS LT500 provides more flexibility than the HydroRanger 200, MultiRanger 100/200, or LUT400. For instance, choosing one or three relays with the HydroRanger 200 gets you only the level version controller. If you opt for the HMI version, it comes with only 6 relays. With the LT500, you can select one, three, or six relays, and all the level and pump functionality remains available, no matter how many relays are ordered for this comprehensive level and pump controller, so if your application needs change, the LT500 is ready.

Also, it's worth noting that the relay contacts listed below are in the de-energized state. All relays are handled the same way and can be configured as positive or negative logic using the polarity parameter in the setup menu.

In case of power failure, all relays will fail in their de-energized states.

- Relays 1, 2, 4 and 5 are normally open and will fail open
- Relays 3 and 6 can be wired either normally open or normally closed
