

LEVEL MATTERS

Did you know?

To utilize Auto False Echo Suppression (AFES), there is no need to subtract two feet from the distance to the material surface as with other transmitters. With the SITRANS LR100 series, all that is required is the distance to the material surface. AFES will be implemented for the range to the material distance minus 0.35 meter (14 inches). See the drop in the suppression curve (brown curve) below.

The black vertical line is the distance to the material surface.
